

# TAPECONCURRENT

## Product datasheet

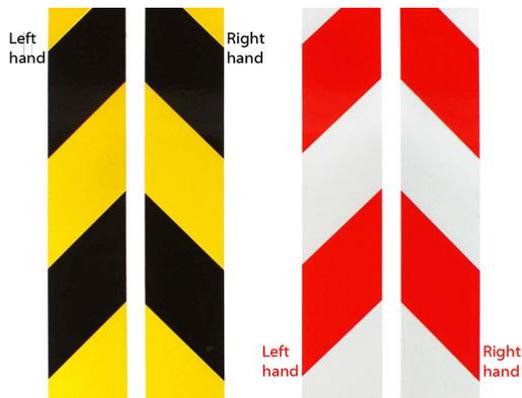

### Reflective Marking Tape

Reflective tape is a simple, self-adhesive, high visibility safety tape, suitable for marking out potentially hazardous or dangerous areas. It can be effectively used in any environment, and takes literally minutes to apply.

Formerly just a constituent to some of our other materials, reflective marking tape is now available in self adhesive rolls.

We can offer reflective tape in widths anywhere from 15mm to 1220mm and up to 10m in length, but as always, dependant on quantity, we can cater to your requirements. All the colours mentioned above are stocked in large quantities, so can be shipped immediately, and samples are available on request.

#### Left and Right Hand Variants

We can offer these in all the different sizes that we offer our solid colour reflective tapes.

## **Application**

Reflective marking tape is perfect for application in many areas:

### **Walkways**

Reflective marking tape is great for marking out vital routes to be used either at all times, or routes to follow in an emergency. All colours are suitable to use for floor marking, however, you can refer to our colour reference guide for advice on which colour to use for your requirements.

### **Stairways**

Stairways can be marked either as a specific or important way through for access or egress to or from a building or room. Stair ways can also be marked to highlight them also, and remind me people to take caution when ascending or descending them.

### **Ledges**

Marked so workers or guests will be notified to use caution when working or near ledges.

### **Low hanging objects**

Certain parts of structures can be at head height for some, therefore they are required to be marked to prevent injury. By adding reflective marking tape to areas that could cause injury, you can reduce or prevent injuries completely.

The reflective safety tape is coated with a permanent high visibility adhesive coat, which allows for a long term bond, and with it not being water based, it will not break down under testing environmental conditions. A paper backing liner is applied to protect the PSA ( pressure sensitive adhesive ) prior to application.

If you would like information on how to apply reflective tape, you can view our video.
